Claims

30

- 1. A method for operating a steam power installation (1), whereby steam (D) generated in a boiler (3) is condensed in a condenser (7) after flowing through at least one turbine (5), and the condensate (K) obtained is preheated and fed back to the boiler (3) as feed-water (S), characterized in that the condensate (K) is divided for condensate preheating into a first partial flow (K_1) and a second partial flow (K_2) , only the first partial flow (K_1) being preheated, and the second partial flow (K_2) being remixed with the preheated first partial flow (K_1) .
- 2. The method as claimed in claim 1, characterized in that the first partial flow (K_1) is preheated
- characterized in that the first partial flow (K_1) is preheated with bleeder steam (A_1,A_2) from the turbine (5).
- 3. The method as claimed in claim 1 or 2, characterized in that the first partial flow (K_1) is preheated in at least two stages (9A,9B).
 - 4. The method as claimed in claim 1, 2 or 3, characterized in that a preheat temperature (T_s) of the boiler feed-water (S) of 210 °C to 250 °C, in particular 220 °C to 240°C, is set for the mixing of the partial flows (K_1, K_2) .
 - 5. The method as claimed in one of the preceding claims, characterized in that the first partial flow (K_1) and the second partial flow (K_2) are divided in the ratio 0.4 to 0.8, in particular in the ratio 0.6 to 0.7.

- 6. The method as claimed in one of the preceding claims, characterized in that the division of the partial flows (K_1, K_2) is controlled or regulated.
- 5 7. The method as claimed in one of the preceding claims, characterized in that after the mixing of the partial flows $(K_1,\ K_2)$, the mixture is fed as boiler feed-water (S) to a fossil-fired steam generator.
- 8. A steam power installation (1) for implementing the method 10 as claimed in one of the preceding claims, comprising a boiler (3) for generating steam (D), at least one turbine (5), a condenser (7) connected on the steam outlet side of the line (13) for turbine (5), a condensate feeding condensate (K) back to the boiler (3), and a preheating device (15) connected in the condensate line (13) preheating condensate (K), characterized in that a bypass line (17) bypassing preheating device (15) is provided so that the preheating 20 device (15) only receives a first partial flow (K_1) of the condensate (K).
 - 9. The steam power installation as claimed in claim 8, characterized in that the preheating device (15) is connected to the turbine (5) via a bleeder line (19A,19B).
 - 10. The steam power installation as claimed in claim 8 or 9, characterized in that the bypass line (17) has a control valve (21) for regulating a second partial flow (K_2) of the condensate (K) that bypasses the preheating device (15).

30

11. The steam power installation as claimed in claim 8, 9 or 10,

characterized in that the bypass line (17) flows into the condensate line (13) downstream of the preheating device (15).

5

- 12. The steam power installation as claimed in one of the claims 8 to 11,
- characterized in that the preheating device (15) has at least one heat exchanger (23A,23B), in particular a high-pressure preheater.
 - 13. The steam power installation as claimed in one of the claims 8 to 12,
- characterized in that a diversion line (27) that can be activated by a quick-shutoff fitting (25) is connected in parallel with the preheating device (15).
